

Alpecca Entire Project Architecture Map

Trust boundaries, compute ownership, current status, and the dependency spine.

Architecture Matrix

LAYER	STATUS	COMPONENTS	OWNERSHIP RULE
Authoritative local core	PARTIAL	CoreMind, Soul, SQLite, Mindpage, affect, TTS	Must own identity, policy, memory, approvals, and presence
Identity/presence gateway	DONE	Creator principal, sessions, bridge signing, singleton, portal fencing	Cross-process ownership and stale portal rejection are tested
Perception/action broker	PARTIAL	Files, image, audio, screen, webcam, tools, pagefile	Scoped grants and immutable approval receipts
Cloud egress	PARTIAL	Exact-operation consent ledger for provider, deployment, model, and payload	Production adapters remain unwired; deny by default
Mindscape	BLOCKED	Encrypted passive Vault, approved restore path, inert fenced standby	No transactional promotion, provider VM, or simultaneous clone
Embodied surfaces	PARTIAL	House HQ, virtual app, PWA, Discord, V4 VRM	One writable portal; other surfaces observe or request handoff

Compute truth

LANE	ROLE	CAPACITY / GUARANTEE
Local laptop	Authoritative CoreMind, state, policy, identity, approvals, live fallback	Approximately 24 GB DDR4; RTX 3050 Laptop GPU with 4 GB VRAM
Hugging Face ZeroGPU	Optional stateless deep/vision/texture/batch inference	Ephemeral, quota-governed, runtime-probed; never counted as local capacity
Google notebook / Colab	Optional stateless accelerated inference or batch jobs	Ephemeral; GPU, RAM, uptime, and limits are not guaranteed

Compute boundary: cloud-reported RAM and accelerator details are ephemeral runtime facts. They are never local-host specifications or guaranteed capacity.

Dependency spine

#	PHASE	STATUS	BUILD	EXIT GATE
0	Truth baseline and freeze	DONE	Canonical status, local/cloud ownership, bounded claims, and encrypted recovery baseline are established.	Current diagrams follow evidence; ephemeral cloud capacity is never counted as local.
1	Security containment	PARTIAL	Protected HTTP/WS auth, capability audits, device trust, and a zero-finding source plus House secret scan exist.	Retain a final clean-shell publication receipt without exposing credentials.
2	Creator identity, singleton, portal lease	DONE	Stable creator identity, cross-process singleton ownership, and stale portal fencing are tested.	One supported CoreMind and writer; spoofed creator claims and stale portals fail.
3	Turn transactions and context isolation	DONE	Immutable scoped turns, cancellation barriers, and stale-commit rejection are tested.	No cross-actor leak; timed-out work creates no late effects.
4	Cue, commitment, action closure	DONE	The bounded creator-only self_status path is exactly-once and receipt-backed.	Completion language follows durable execution evidence.
